Environmental Research - UFZ

***Compound specific isotope analysis (CSIA) to
characterize degradation pathway and to quantify in
situ degradation of fuel oxygenates and other fuel
derived contaminants***

***Anko Fischer, Monica Rosell², Max M. Häggblom³
and Hans H. Richnow***

Dpt. of Isotope Biogeochemistry, UFZ

²Dpt. of Environmental Chemistry, IIQAB-CSIC

³Dpt of Biochemistry, Microbiology, and Biotechnology, The State
University of New Jersey

Out line

- Principles of isotope chemistry
- Analysis of stable isotopes
- Analysis of degradation processes
- Quantification of in situ degradation

Major elements of organic substances

	natural abundance (atom %)				<div style="border: 1px solid black; padding: 5px; display: inline-block;"> Isotope ratio $\frac{^{13}\text{C}}{^{12}\text{C}} = \frac{1,11}{98,89} = R$ </div>
Hydrogen	¹ H 99.9844	² D 0.0156		⇒	
Carbon	¹² C 98.89	¹³ C 1.11			
Nitrogen	¹⁴ N 99.64	¹⁵ N 0.36			
Oxygen	¹⁶ O 99.763	¹⁷ O 0.0375	¹⁸ O 0.1995		

Hoefs, 1997

Isotope ratios are reported in δ notation relative to an international standard

Carbon: in ‰ PDB (Belemnite, Cretaceous Peedee Formation, South Carolina)

$$\delta^{13}\text{C} (\text{‰}) = \left(\frac{^{13}\text{C}/^{12}\text{C}_{\text{sample}} - ^{13}\text{C}/^{12}\text{C}_{\text{standard}}}{^{13}\text{C}/^{12}\text{C}_{\text{standard}}} \right) \times 1000$$

Kinetic Isotope Effect (unidirectional reactions)

Difference of reaction rates (activation energy) between light and heavy isotopes leads to fractionation

Stefan Harderlein, 2006

Isotope Fractionation

Kinetic isotope effect

- Irreversible/unidirectional reactions
- Isotopes move/react at different rates (smaller isotopes have greater velocity bonds with light isotopes are broken more easily)
- *Can be very substantial*

• **Thermodynamic isotope effect**

(also known as equilibrium or exchange effect)

- Reversible reactions *at equilibrium*
- Based on free energy differences (heavier isotope forms stronger bonds / accumulates in phase with stronger interactions)
- For organic molecules *often rather small*

Stefan Harderlein, 2006

Challenge:

Process identification and quantification based on isotope signatures

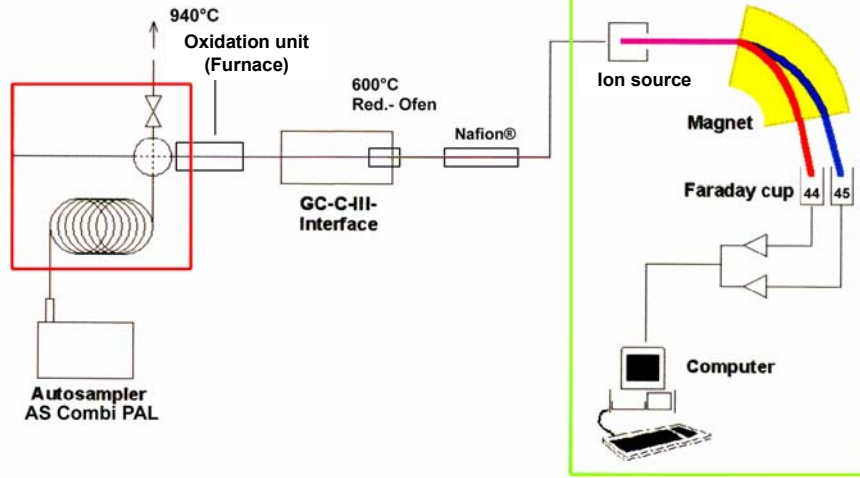

Haderlein, 2006

Interface GC/C-IRMS/MS

GC (HP 6890 Series, Agilent Technology)

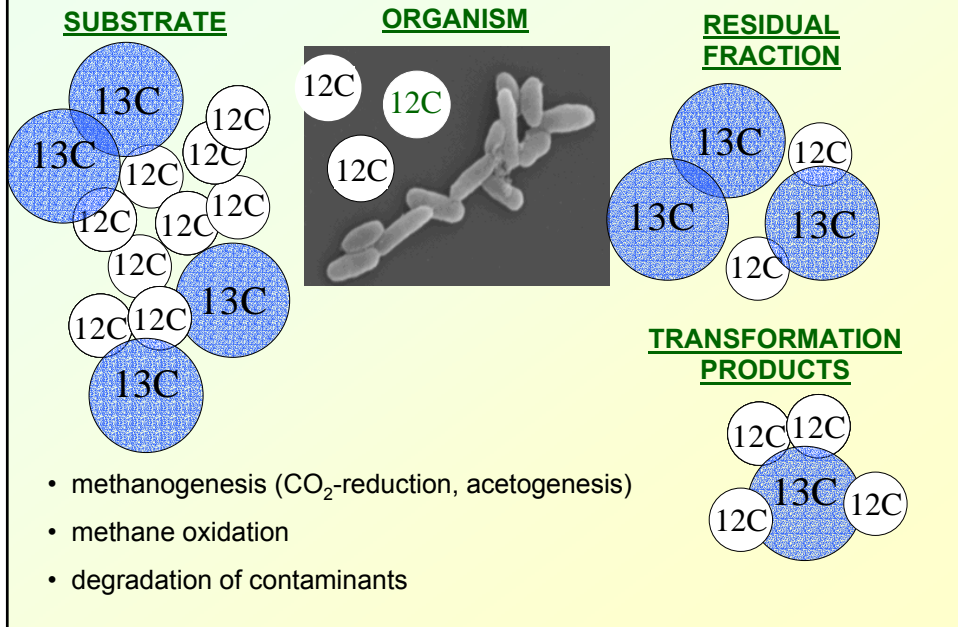

IRMS: MAT 252 (Finnigan MAT)

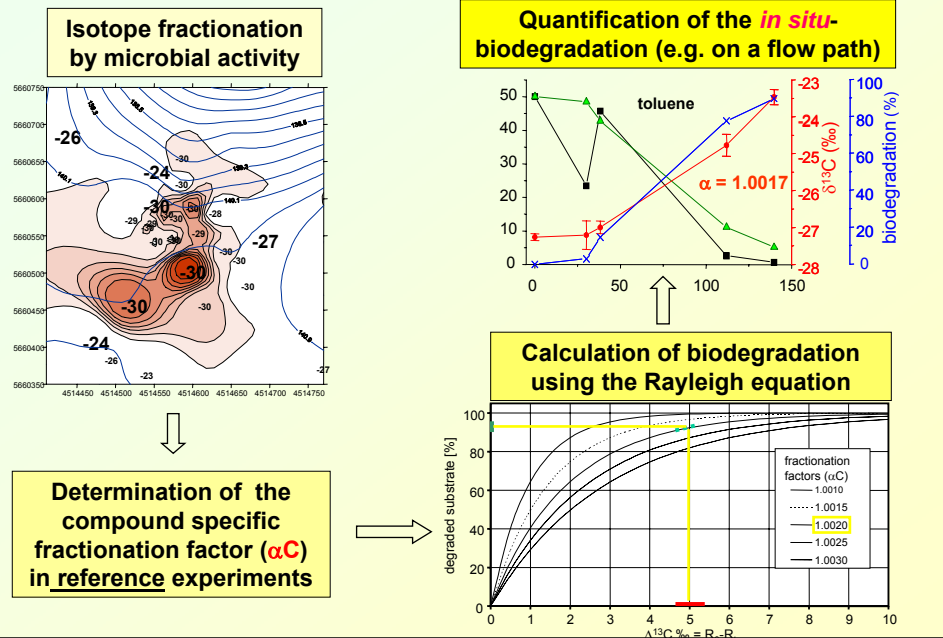

Sensitivity and Precision of GC-IRMS

Element	Analyzed gas	[nmoL] On-column	[ng] On-column	Precision
Carbon	CO ₂	0.8 nmoL C	10 ng C	0.2 ‰
Nitrogen	N ₂	1.5 nmoL N ₂	42 ng N	0.5 ‰
Hydrogen	H ₂	15 nmoL H ₂	30 ng H	3 ‰
Oxygen	CO	80 nmoL O	80 ng O	0.8 ‰

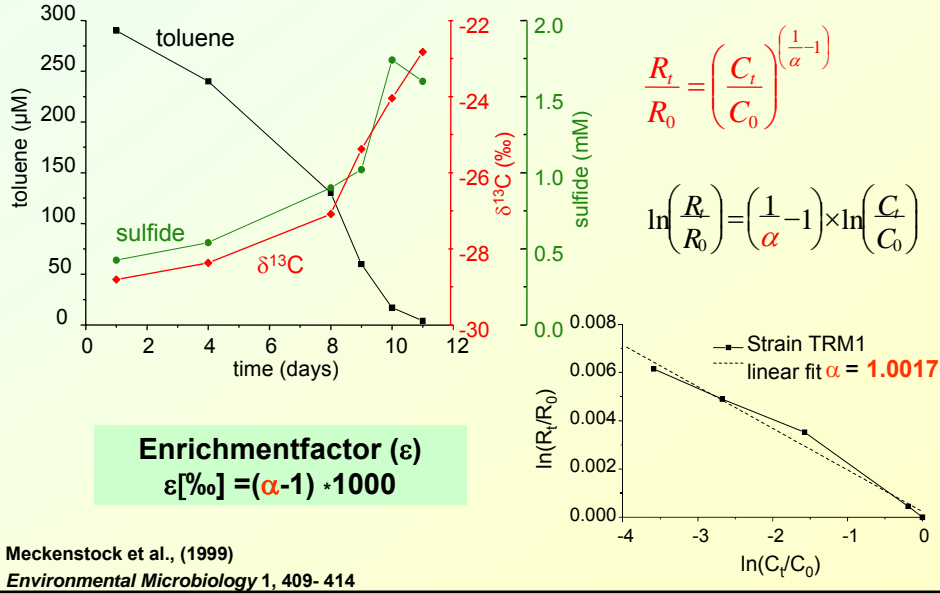

Isotope fractionation process

Quantification of microbial activity in aquifers using isotope fractionation

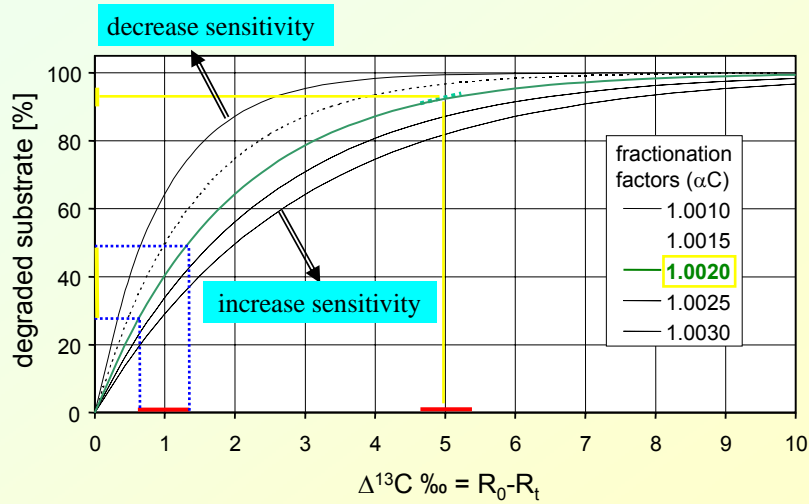

toluene degradation by sulfate-reducing bacteria

Precision of the calculation

Degradation model with various fractionation factors (α_C)

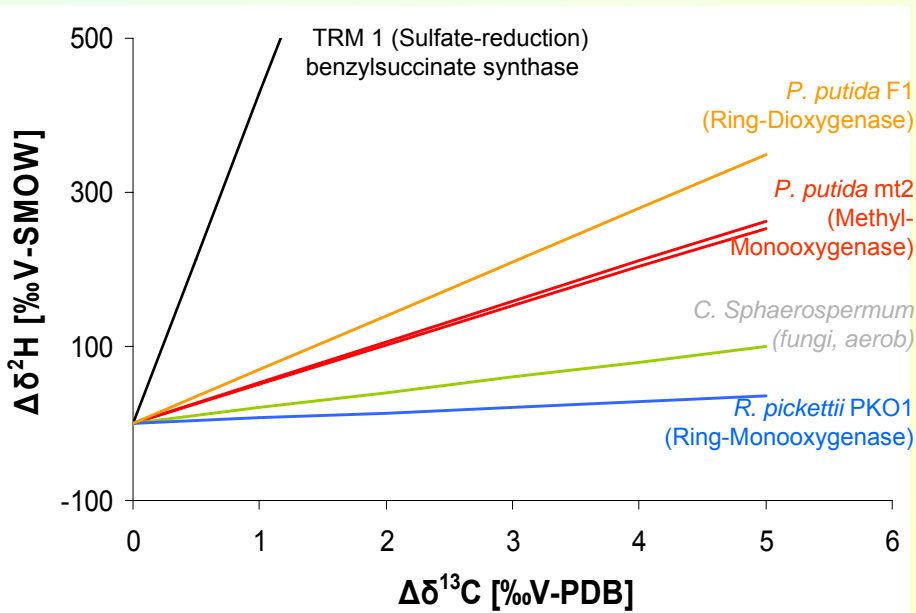

Meckenstock et al., JCH, 2005

Isotopic fractionation factors (α_C) of **anaerobic** and **aerobic** degradation pathways (Morasch et al. 2001, 20002, 2004)

Selection of a fractionation factor (α) representing the geochemical degradation conditions is important !

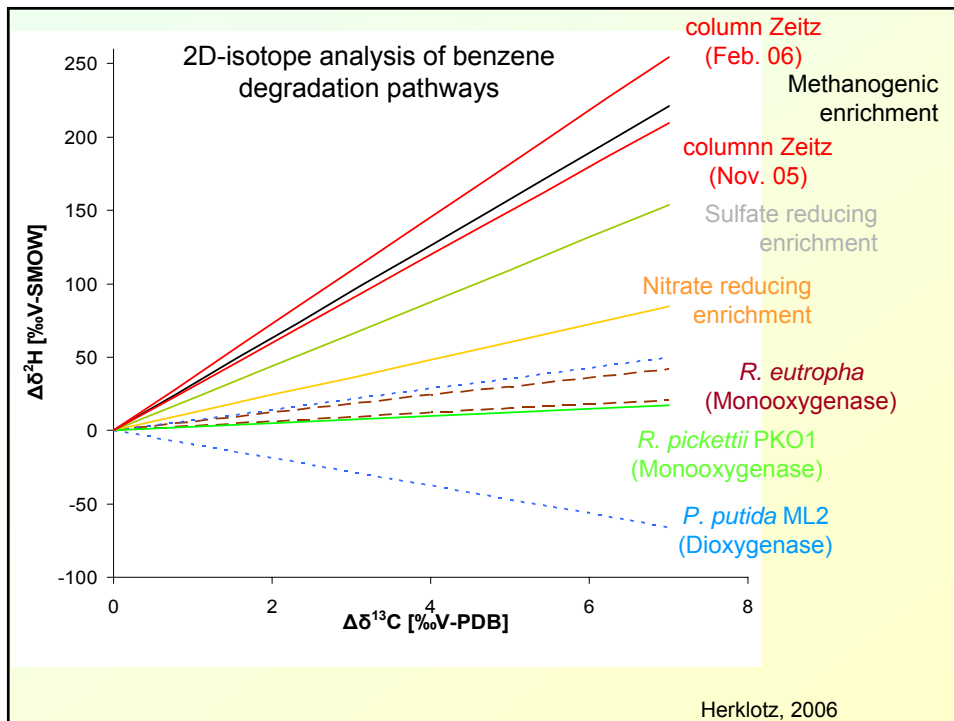

Carbon and hydrogen fractionation to analyze the toluene degradation pathway (2D-isotope analysis)

Mancini et al. 2003; Morsch et al. , 2001,2002; Meckenstock et al. 1999, Herklotz, 2006

Carbon and hydrogen fractionation of **benzene** degradation pathways

Organisms	Condition	Pathway	ϵ_C	ϵ_H	Reference
<i>P. Putida</i>	aerob	Dioxygenase	<-0.6	<-0.7	Herklotz 2006
<i>R. Picketii</i> PK01	aerob	Monooxygenase	-1.8	-4.7	Herklotz 2006
<i>R. Eutropha</i>	aerob	Monooxygenase	-4.3	-19.7	Herklotz 2006
Enrichment	nitrate reducing	??	-2.4	-29	Mancini et al. 2003

Sand column	sulphate reducing	??	-1.9	-70.2	Fischer et al., 2006

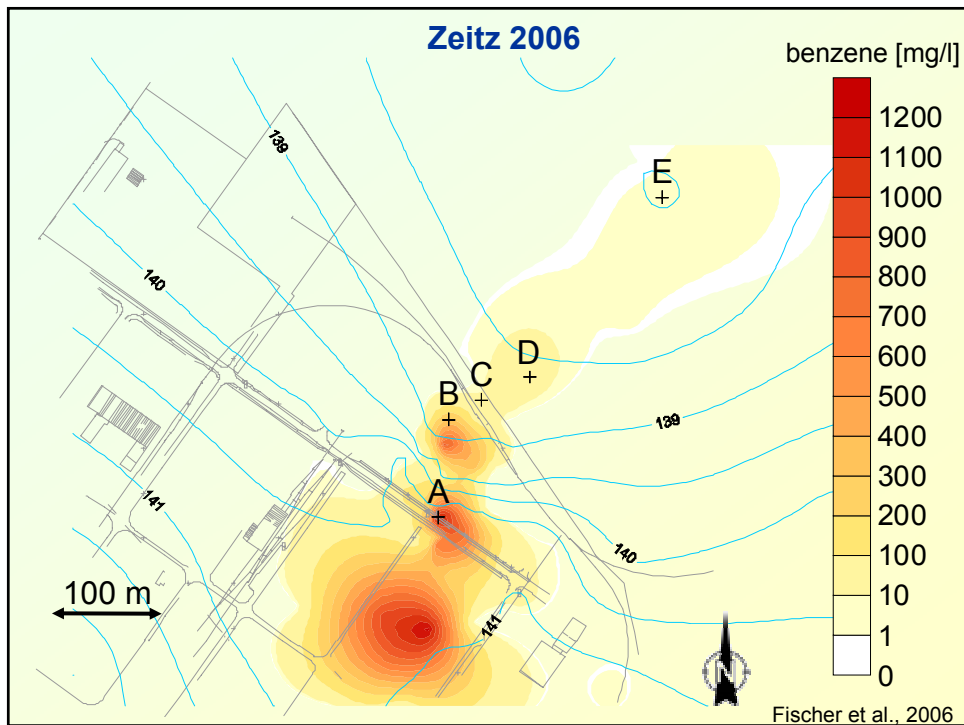

Field study in Zeitz

- former hydrogenation plant (Zeitz, Germany)
- highly BTEX contaminated aquifer

Microbial degradation processes:

sulfate reduction

- > methanogenesis
- > denitrification
- > iron reduction

Quantitative assessment using the Rayleigh Equation

$$\frac{R_t}{R_0} = \left(\frac{C_t}{C_0} \right)^{\left(\frac{1}{\alpha} - 1 \right)}$$

\downarrow

calculation of **theoretical local concentrations** is possible if a representative C_0 entering a flow path and the hydrology is known

$$C_t = C_0 \times \left(\frac{R_t}{R_0} \right)^{\left(\frac{1}{\alpha} - 1 \right)}$$

“percentage of biodegradation” can be used as an index to characterise zones of active in-situ biodegradation

$$B[\%] = \left[1 - \left(\frac{R_t}{R_0} \right)^{\left(\frac{1}{\alpha} - 1 \right)} \right] \times 100$$

calculation of **theoretical concentrations** entering a flow path (C_0) using measured concentration (C_t) and the isotope compositions

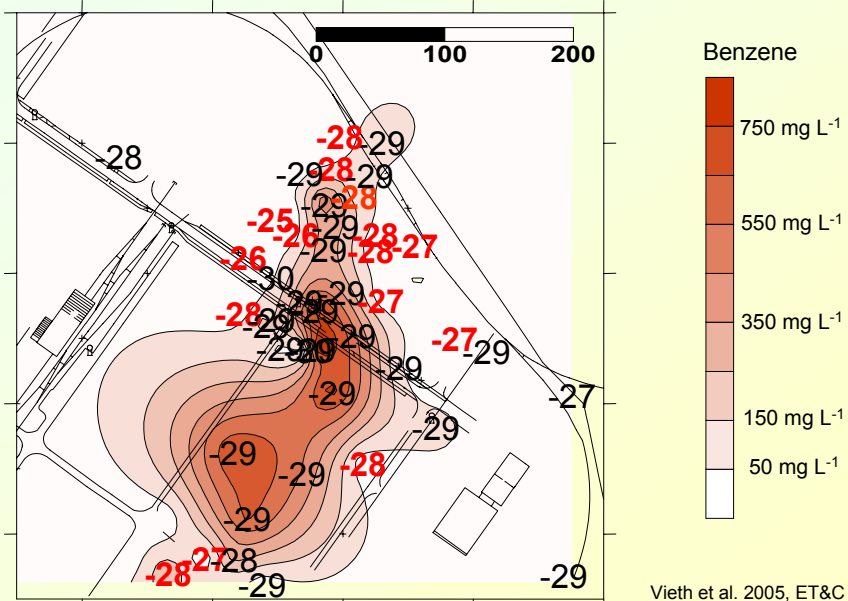

$$C_0 = \frac{C_t}{\left(\frac{R_t}{R_0} \right)^{\left(\frac{1}{\alpha} - 1 \right)}}$$

C_0 = initial concentration of the source
 C_t = concentration at time t
 R_0 = initial isotope ratio of the source
 R_t = isotope ratio at time t
 α = isotope fractionation factor

Concentration and isotope composition of benzene

Hydrogenation plant, Zeitz

electron acceptors: $\text{SO}_4^{2-} \gg \text{CO}_2, \text{Fe(III)}, \text{NO}_3^-$

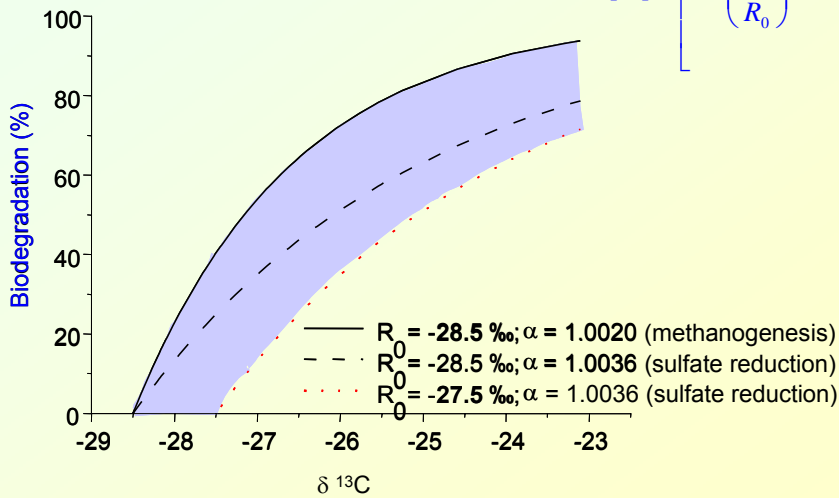

Uncertainty of *in situ* biodegradation taking into account

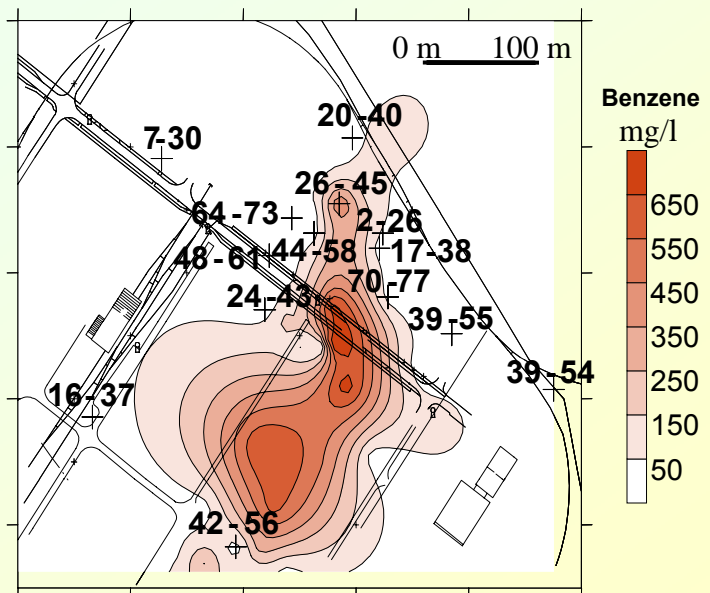

- isotope variability of the source (R_0)
- variability of isotope fractionation factor (α)

$$B[\%] = \left[1 - \left(\frac{R_t}{R_0} \right)^{\left(\frac{1}{\alpha - 1} \right)} \right] \times 100$$

Biodegradation [%] of benzene in sulfidogenic aquifer (Zeitz)

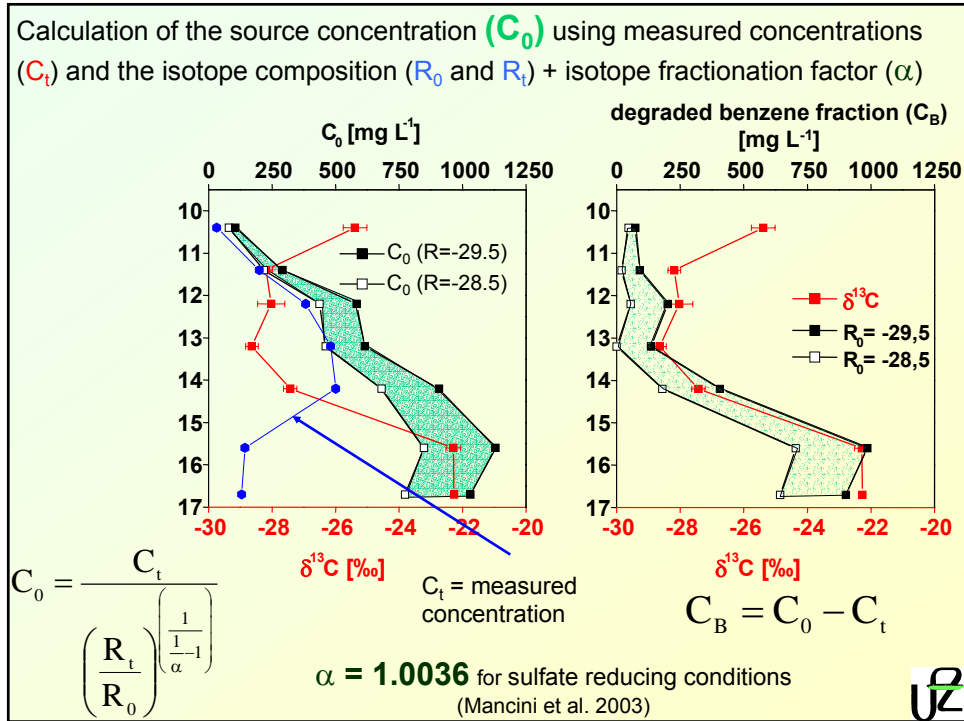

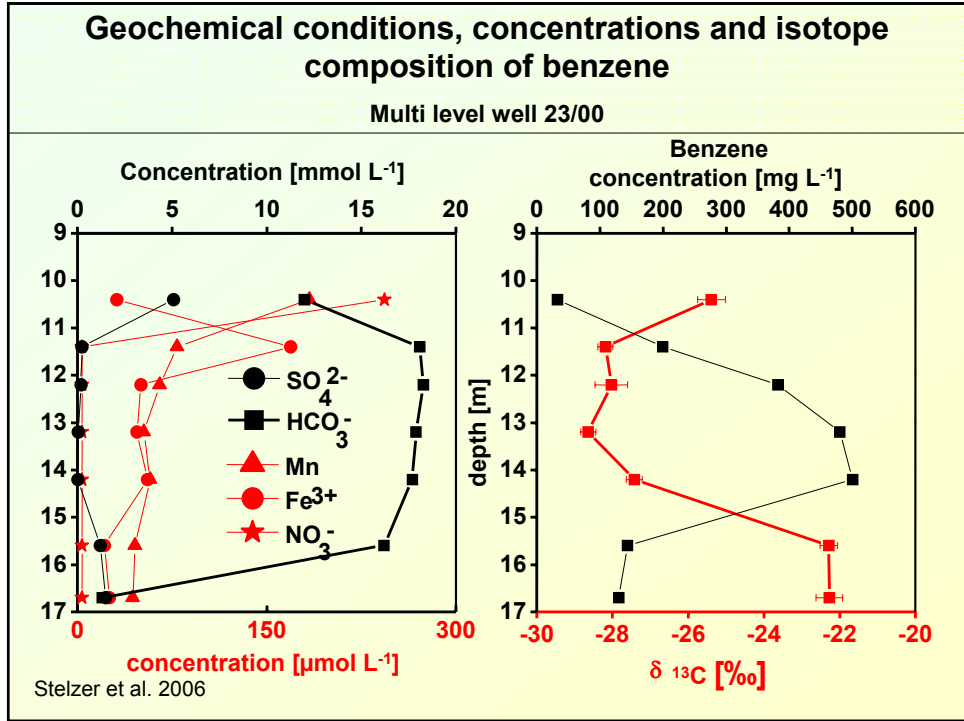

* $\alpha = 1,0036$ (Mancini et al., 2003) source (R_0) = -27,5 to -28,5 ‰

Vertical plume analysis

Multi-level-packer-system

Schirmer et al., 1995

Fuel oxygenates tested for biodegradation and isotope fractionation under aerobic anaerobic biodegradation

methyl *t*-butyl ether
(MTBE)

t-amyl methyl ether
(TAME)

ethyl *t*-butyl ether
(ETBE)

Ether type fuel oxygenates are relatively recalcitrant under both aerobic and anaerobic conditions

- alkyl ethers are relatively stable
- the tertiary carbon structure is relatively resistance to microbial attack

Stoichiometric formation of TBA indicate an ether cleavage during MTBE degradation

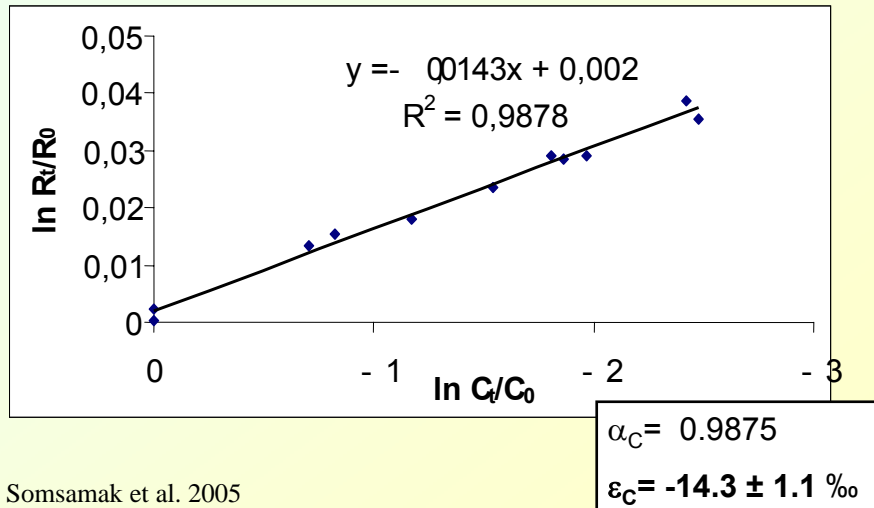

Somsamak et al. 2005

¹³C/¹²C Fractionation of sulfidogenic MTBE Degradation

- sulfidogenic enrichment cultures derived from Coronado located on the San Diego Bay in California (USA)

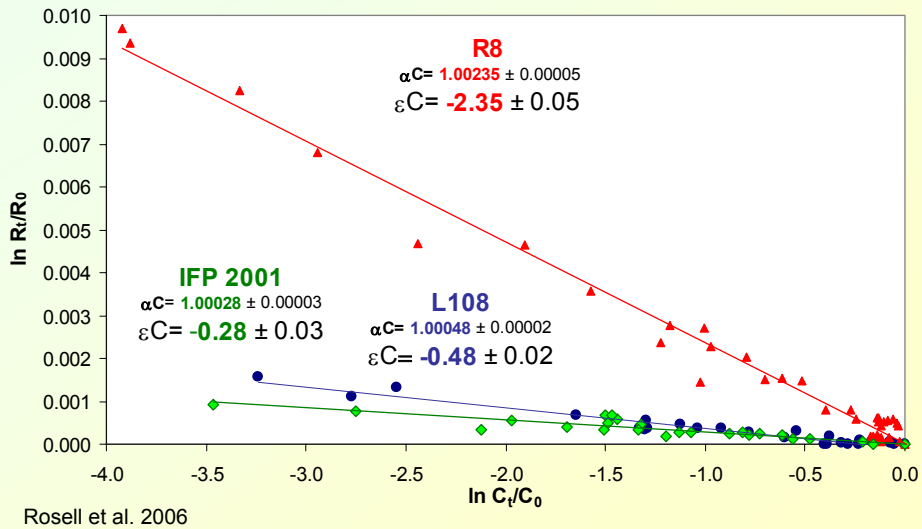

Isotopic enrichment factors (ϵ) for anaerobic biodegradation of MTBE.

Aerobic pathways for initial attack on MTBE

Monoxygenase reaction

Cleavage of H-C-bond → D, ¹³C-fractionation

Hunkeler et al., 2001; Zwang et al., 2005

In situ stable isotope fractionation at a refinery site

Analysis of 21 wells and 1 ML well

MTBE conc. 0.29 to 7200 mg/L

Constant carbon and hydrogen isotop signatures close to the source:

$\delta^{13}\text{C} = -32.7 \pm 0.2 \text{ ‰}$

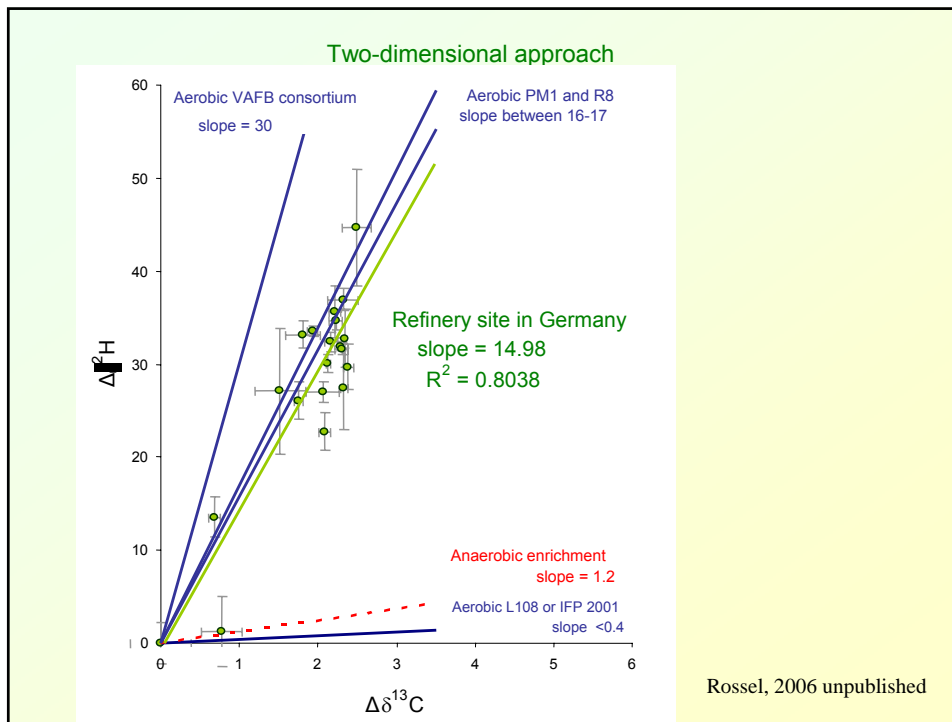

$\delta^2\text{H} = -238.5 \pm 3.1 \text{ ‰}$

Only fractionation in well P25 (0.29 mg/L)

$\delta^{13}\text{C} = -30.98 \pm 0.60 \text{ ‰}$

Multilevel well P26

Isotope fractionation has been applied to evaluate ground water contamination by

- fuel related compounds (BTEX and MTBE)
- chlorinated solvents
- halogenated aromatic compounds

(see Meckenstock et al. 2004, JCH, for an recent overview)

Uncertainties associated to assess in situ biodegradation in the course of a contamination plume

- analytical uncertainty determining the isotope ratio ($R_i; R_0$) and concentration ($C_i; C_0$)
- selection of a representative fractionation factor (α)
- determination of a representative source concentration (C_0)
- variability of the isotope composition of the source (R_0)
- aquifer inhomogeneities and associated mixing processes

Reductive Ether Cleavage ???

- relatively high $\epsilon_C = 8.6$ to 16 relatively low $\epsilon_H = 16$

→ Hydrogen is not directly involved in the kinetic control of reaction (low fractionation)

- Acetogenic bacteria can use aromatic or aliphatic O-methyl substituents as a carbon source
- Inhibition experiments may suggest activity of a syntrophic microbial consortia

Isotope fractionation processes (α_C , α_D) can be used to characterise anaerobic and aerobic BTEX and MTBE degradation processes in the field

Potential for monitoring operation and quantification of in situ biodegradation

More systematic work is needed on isotope fractionation of fuel oxygenates to obtain fractionation factors (α_C , α_D)

We need to understand degradation pathways and the physiology of anaerobic microbial in situ communities

Indication for anaerobic biodegradation by carbon and hydrogen isotope fractionation

Evaluation of 3 anaerobic field sites in the US
