Partitioning based Passive Sampling

Foppe Smedes

Deltares, Utrecht, The Netherlands

RECETOX, Masaryk University, Brno Czech Republic

NORMAN Inter-Laboratory Study (ILS) on passive sampling of emerging pollutants
DG Joint Research Centre, 29 – 30 October, 2012, Ispra, Italy

Pollution level in aqueous systems

In formula:
$$\frac{C_{Sed}}{A_{Sed}} = \frac{C_{SPM}}{A_{SPM}} = \frac{C_{DOC}}{A_{DOC}} = \frac{C_W}{S_W} = \frac{P}{P_0} = \frac{C_{Lipid}}{S_{Lipid}}$$

Pollution level in aqueous systems

uptake cap. (A_{Sed})

In formula:

$$\frac{C_{Sed}}{A_{Sed}} = \frac{C_{SPM}}{A_{SPM}} = \frac{C_{DOC}}{A_{DOC}} = \frac{C_W}{S_W} = \frac{P}{P_0} = \frac{C_{Lipid}}{S_{Lipid}} = \frac{C_{REF}}{S_{REF}}$$

Note: In the original image, C_{DOC} and P are crossed out with red 'X' marks. C_W is highlighted in a blue box, and S_W , S_{REF} , and C_{REF} are highlighted in green boxes. A_{Sed} , A_{SPM} , and A_{DOC} have orange question marks below them.

$$K_{Ref-W} = \frac{S_{Ref}}{S_W} = \frac{C_{Ref}}{C_W}$$

What's on the program

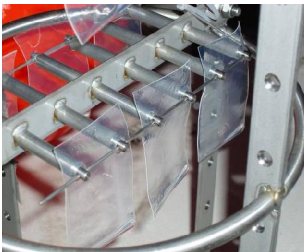

- Different passive samplers
- Procedures, material and methods
- Working principles
- Parameters
- Data processing

Passive sampler types

Macro samplers → extract and multiple analyses

- semipermeable membrane devices “SPMD” → 
- single-phase strip samplers
 - low-density polyethylene (LDPE) → 
 - polydimethylsiloxane (PDMS, silicone rubber)
 - polyoxymethylene (POM)
- C18-based disk samplers (ChemCatcher, a.o.) → 
- (ceramic dosimeter)
- (Polar compounds: POCIS, C18....) → 

Micro passive samplers → all sorbed is injected - one shot

- solid-phase microextraction (SPME) → 
- stir bar sorptive extraction (SBSE)
- rod samplers (MESCO) → 

Continuous flow integrative samples (CFIS)

Capable of sampling both dissolved and particulate fraction.

Deployment of SR and SPMD

Ground water

After exposure

Cleaning sheets after recovery

Cleaning samplers in the lab

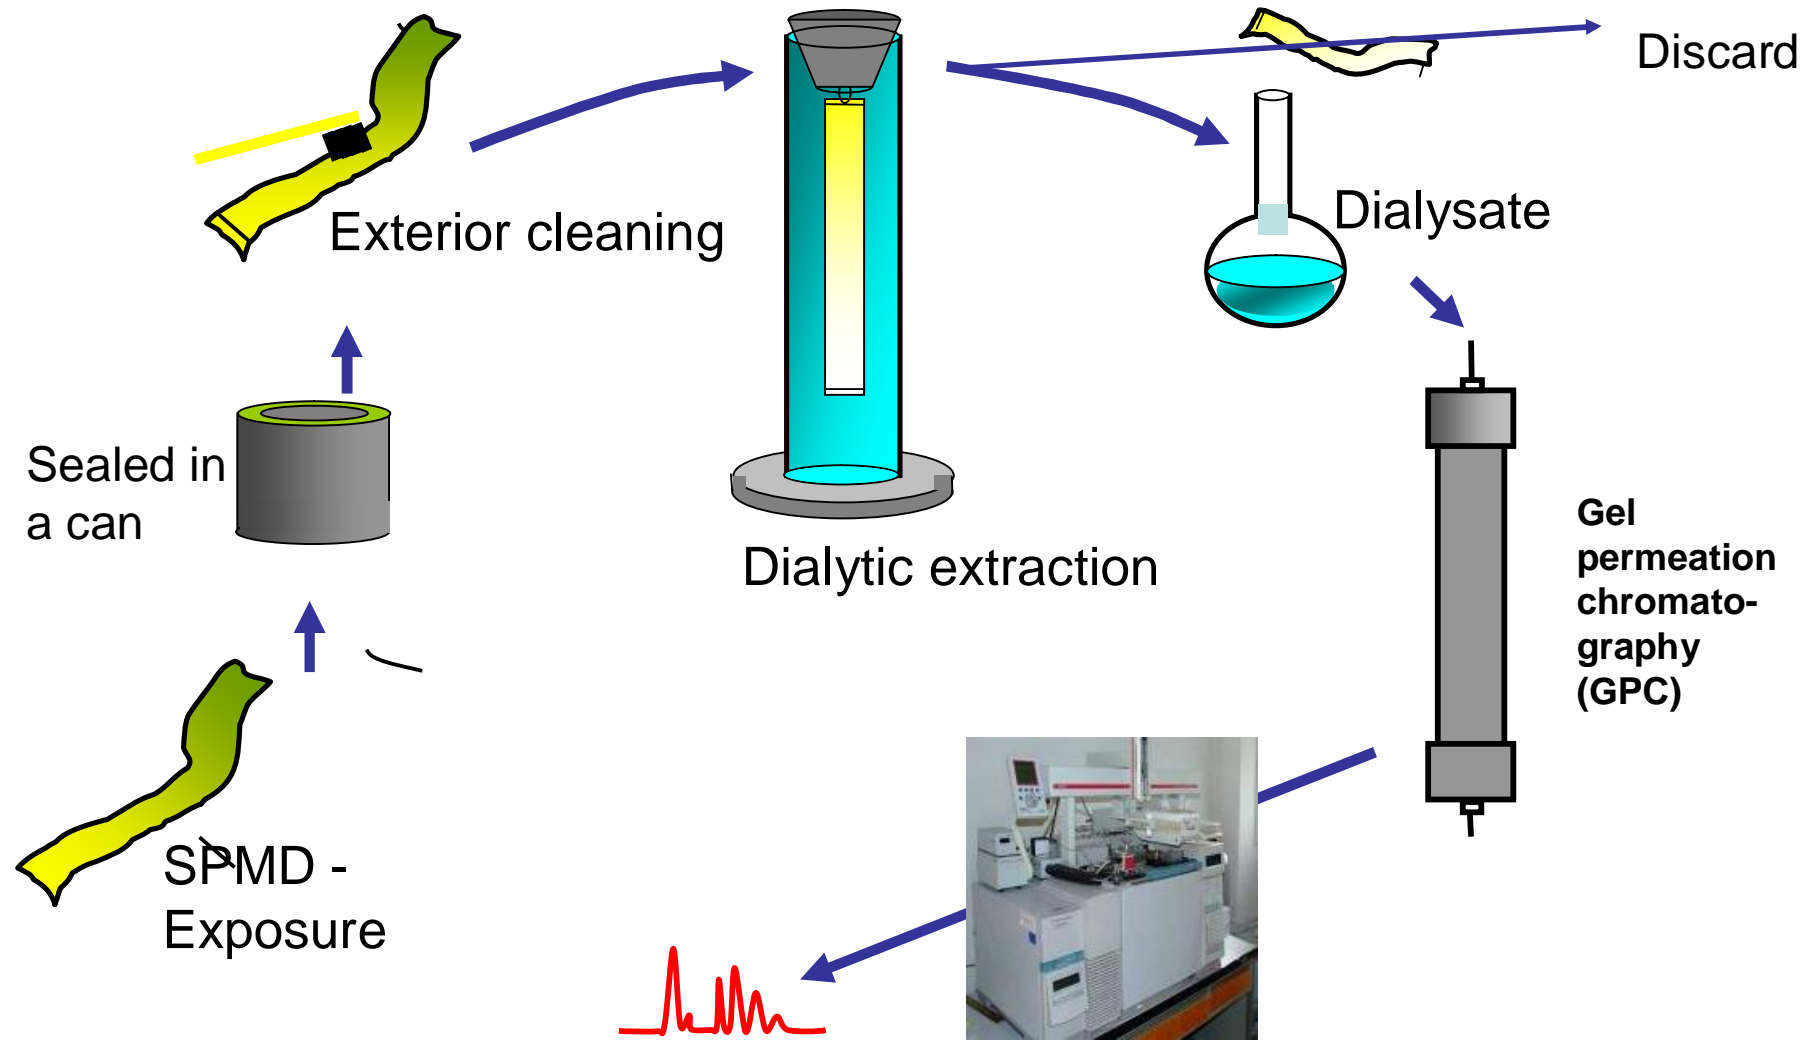

During transport and storage redistribution could occur

Better clean samplers in the field with local water and scourer

Processing of passive samplers: SPMD

Working principles - calibration

- Uptake process
Equilibrium or linear uptake

Parameters required

K_{pw} determination by cosolvent method

Mol fraction methanol →
Concentration of analyte →
 Final concentration in extract \approx constant

$\log K_{pm}$ decreases ↘
 Exposure volume ↘

Relation of R_s with hydrophobicity

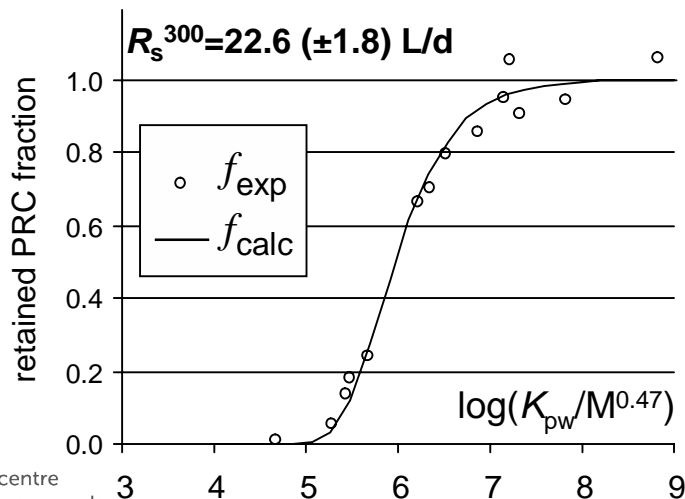

Examples of fitting

2001 Autumn, Station 1 Wadden Sea

2010 Winter, Station 1 Wadden Sea

Biofouled!

Caclulation of C_w

General equation :

$$C_w = \frac{N_t}{K_{pw} m \left(1 - \exp\left(-\frac{R_s t}{K_{pw} m}\right) \right)}$$

Inserting model for R_s :

$$C_w = \frac{N_t}{K_{pw} m \left(1 - \exp\left(-\frac{FA t}{K_{pw} M^{0.47} m}\right) \right)}$$

Sampling rates and aqueous concentrations
can be calculated retrospectively

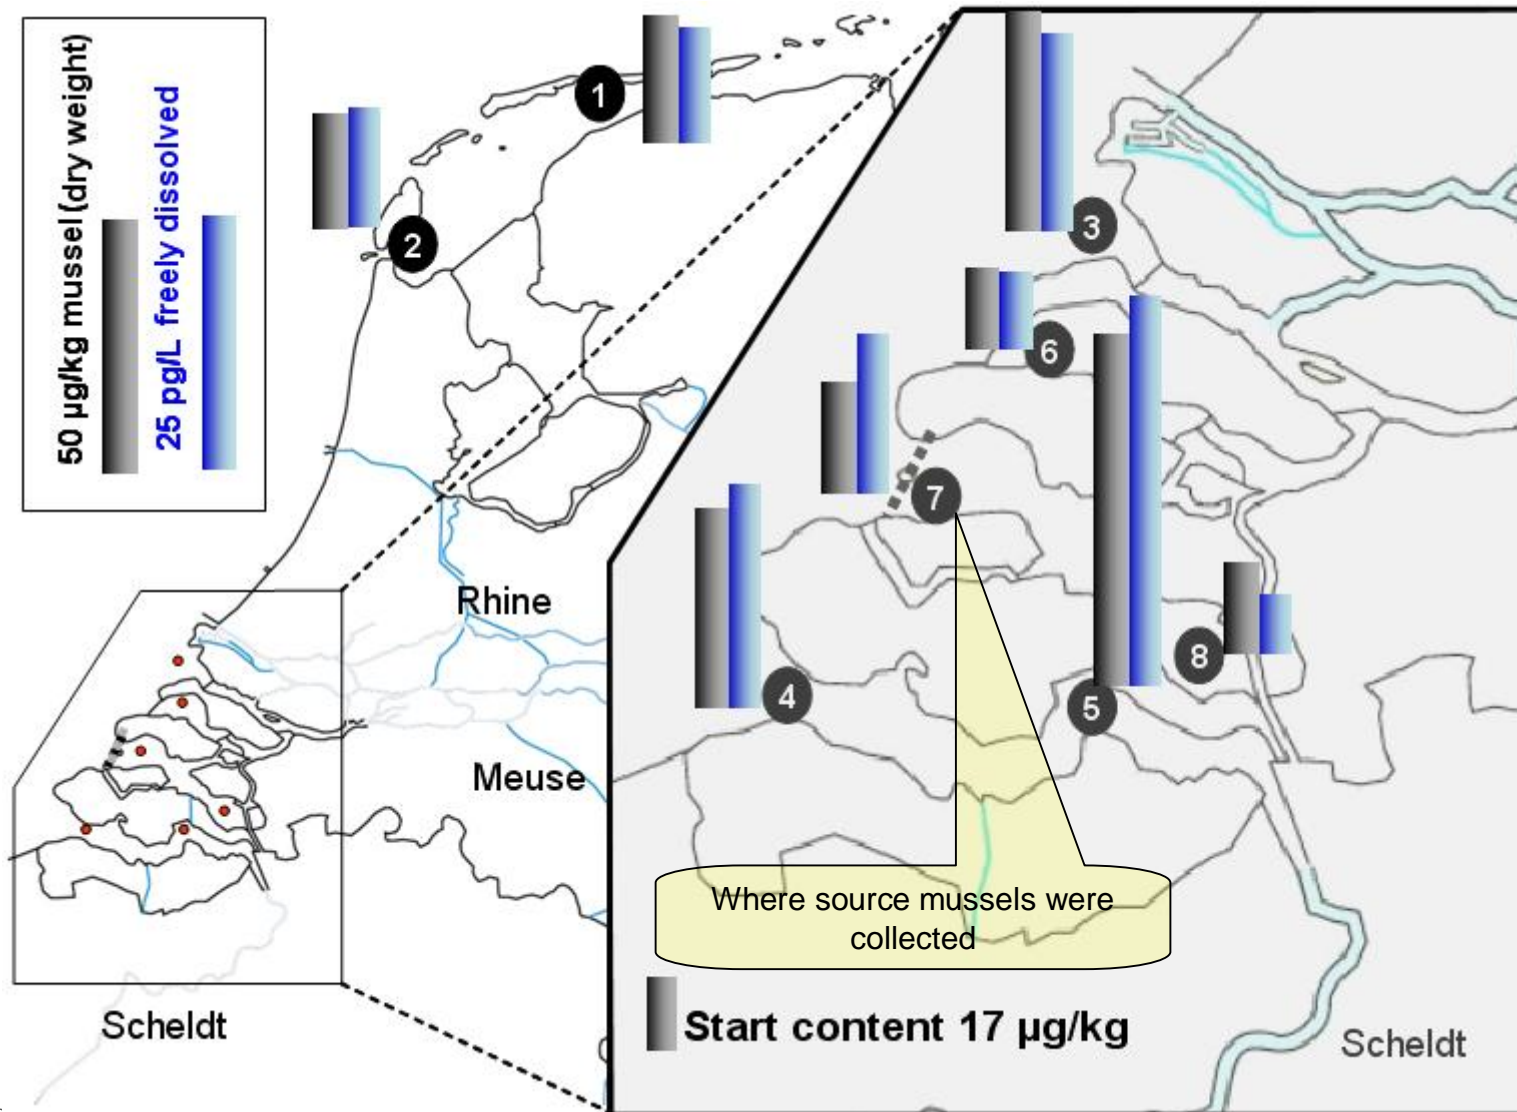

**A lot of things to consider,
is that worth while?**

Spatial distribution for PCB 153 in mussels and water
